# DEVELOP A C PROGRAM TO ANALYZE A GIVEN C CODE SNIPPET AND RECOGNIZE DIFFERENT TOKENS, INCLUDING KEYWORD, IDENTIFIERS, OPERATOR AND SPECIAL SYMBOLS

### AIM:

To develop a C program that analyzes a given C code snippet and recognizes different tokens, including keywords, identifiers, operators, and special symbols.

□ Start	
☐ Take a C code snippet as input from the user or a file.	
☐ Initialize necessary arrays and variables for keywords, identifiers, operators, and special	al
symbols.	
☐ Tokenize the input string using spaces, newlines, and other delimiters.	
☐ For each token:	
<ul> <li>Check if it is a keyword (compare with a predefined list of C keywords).</li> <li>Check if it is an identifier (valid variable/function name that doesn't match a keyword).</li> <li>Check if it is an operator (e.g., +, -, *, /, ==, &amp;&amp;).</li> <li>Check if it is a special symbol (e.g., {, }, (, ), ;, ,).</li> </ul>	

- ☐ Print the categorized tokens.
- □ End

# **OUTPUT:**

```
Enter a C code snippet:
int main() {
    int a = 5, b = 10;
    float c = a + b;
    if (c > 10) {
        printf("Result: %f", c);
    }
    return 0;
}

Recognized Tokens:
Keyword: int
Identifier: main()
Special Symbol: {
```

# **RESULT:**

Thus the above program reads a C code snippet, tokenizes it using space, tab, and newline as delimiters, classifies each token as a keyword, identifier, operator, or special symbol based on predefined lists, and prints the recognized tokens along with their types.
